

Develop a simple React JS (or React Native) application that uses this API:

<https://coinmarketcap.com/api/documentation/v1/#operation/getV1CryptocurrencyListingsLatest>

Gather the information about the cryptocurrencies and present this information in a user-appealing way.

Application can be very simple (one screen) although the technical choices (ie using redux, coding standards, folder structure, unit testing, and more) made and the code itself should be enterprise-grade to demonstrate your professional development skills.

Bonus points if you add routing/navigation and add another screen that user can navigate to.

Once you are done you can share a GitHub link with us.

The test itself should take less than a day however you can do it at your convenience and get back to us in a week's time.
